

Lily

Warner Robins

On August 25, 2020, Lily was born via c-section after doctors discovered she was in a breech position. High levels of bilirubin were detected during her newborn checkup. Doctors diagnosed Lily with ABO Incompatibility, a condition in which a newborn's blood type is different from the birthing parent's blood type which can cause jaundice. Due to continued high levels of bilirubin, Lily was admitted to Beverly Knight Olson Children's Hospital where she received light therapy to bring down her bilirubin levels. "We are glad to have our children's hospital so close to home. They discovered why Lily was losing weight and helped her get better", says Ut, Lily's mom.

Today, Lily is a healthy, active 3-year-old who loves going to school and playing with her friends at the park.
